

# TMI System

A Manufacturing Test Framework

Ver08

# What does it do?

- Provides a framework to develop production (or Engineering) test suites
- TMISStation
  - Runs Python (3.6) test code
  - Easy API for collecting results, setting Pass/Fail
  - Executes test code driven by JSON "script"
    - Human readable, a non-programmer can make changes
- TMIServer
  - Collects results from TMISStations
  - Stores results in a SQL Database (extracts the JSON)
  - Result traceability

**You worry about test code – TMI handles EVERYTHING else!**

# TMI System Features

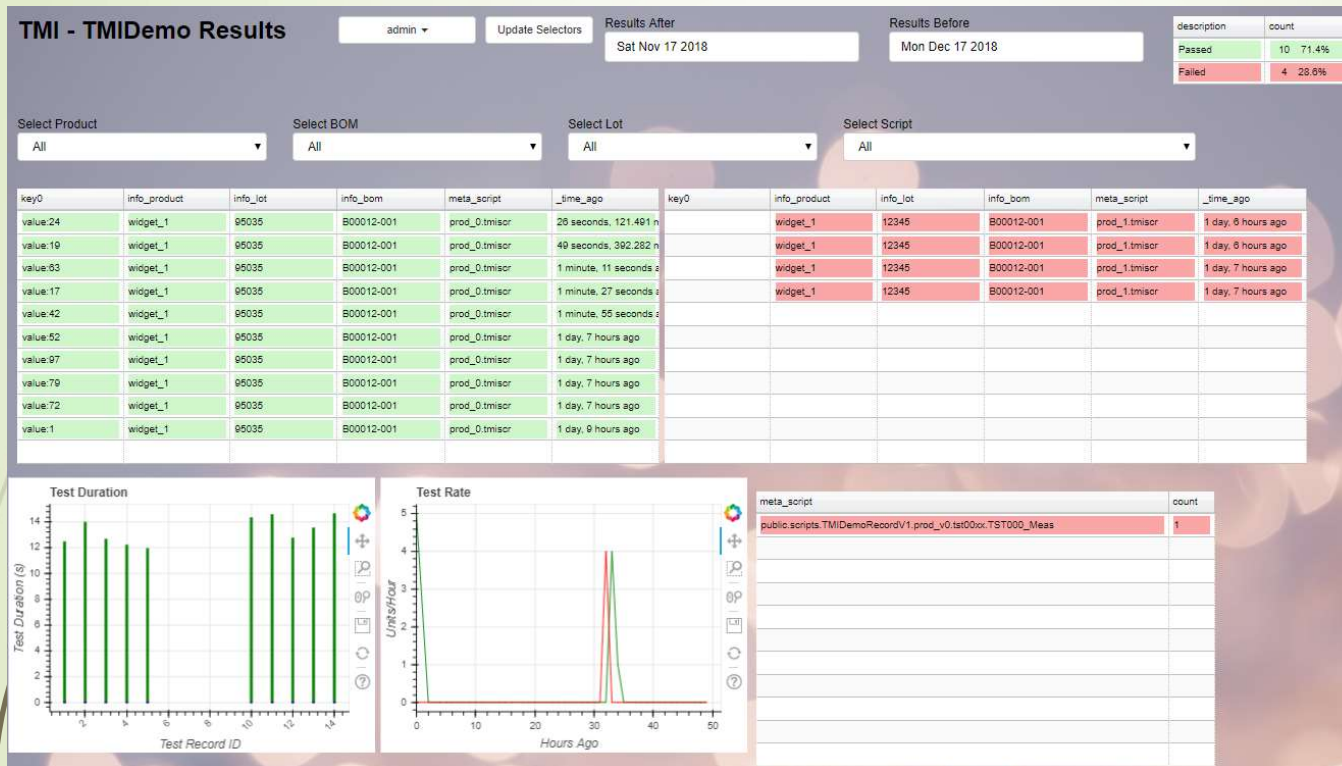

- ▶ JSON Test Scripts
  - ▶ Human readable, enable/disable tests, change limits
  - ▶ Non-programmer can make changes
- ▶ JSON Results
  - ▶ Human readable, easy to post process
- ▶ Result SQL Database
  - ▶ Dashboards and queries
- ▶ Python Codebase
  - ▶ Popular/easy programming
  - ▶ Multi-threaded for concurrency
- ▶ Traceability
  - ▶ Capture serial numbers, lot numbers, and any other identifier information from the DUT
  - ▶ All these identifiers go into SQL DB for query later
- ▶ Results stored in postgres SQL database which can be located anywhere (local, cloud, etc)

# GUI: Testing Panel

- 4 Channels are shown
- Each channel is an independent thread

# Result Server Dashboard

- Graphs to show trends
  - Test Duration and Pass/Fail Hourly Rate

- Top Row selectors to sort data
  - Can view data from a single LOT#
- Select row of Pass/Fail tables to bring up the test record details
- Summary Tables
  - Results reflect Selector settings
  - Pass/Fail Counts
  - Top failed tests and counts

# JSON Test Scripts

- Drives the test bench
- Human readable
- Each test item as an "id", which corresponds to python function that implements the test
- Non-programmer can read this file and make changes

# Python Test Code

- Each test item from the JSON script (previous slide), is a python coded function
- APIs to make test driver code easy
  - Save any measurement
  - Get user input (buttons, text entry)
  - Set product keys (ex serial number)
  - Add logs
- NOTE: Not shown in the code snippet is code related to controlling your hardware to make measurements.

```
def TST000_Meas(self):
    """ Measurement example, with multiple failure messages
    - example of taking multiple measurements, and sending as a list of results
    - if any test fails, this test item fails
    """
    {"id": "TST000_Meas", "enable": true, "args": {"min": 0, "max": 10},
     "fail": [{"fid": "TST000-0", "msg": "Component apple R1"},
              {"fid": "TST000-1", "msg": "Component banana R1"}] },
    :return:
    """
    ctx = self.item_start() # always first line of test
    time.sleep(self.DEMO_TIME_DELAY * random() * self.DEMO_TIME_RND_ENABLE)
    FAIL_APPLE = 0 # indexes into the "fail" list, just for code readability
    FAIL_BANANNA = 1

    measurement_results = [] # list for all the coming measurements...

    # Apples measurement...
    _result, _bullet = ctx.record.measurement("apples",
                                              random(),
                                              ResultAPI.UNIT_DB,
                                              ctx.item.args.min,
                                              ctx.item.args.max)

    # if failed, there is a msg in script to attach to the record, for repair purposes
    if _result == ResultAPI.RECORD_RESULT_FAIL:
        msg = ctx.item.fail[FAIL_APPLE]
        ctx.record.fail_msg(msg)

    self.log_bullet(_bullet)
    measurement_results.append(_result)

    # Bananas measurement...
    _result, _bullet = ctx.record.measurement("bananas",
                                              randint(0, 10),
                                              ResultAPI.UNIT_DB,
                                              ctx.item.args.min,
                                              ctx.item.args.max)

    # if failed, there is a msg in script to attach to the record, for repair purposes
    if _result == ResultAPI.RECORD_RESULT_FAIL:
        msg = ctx.item.fail[FAIL_BANANNA]
        ctx.record.fail_msg(msg)

    self.log_bullet(_bullet)
    measurement_results.append(_result)

    # Note that we can send a list of measurements
    self.item_end(item_result_state=measurement_results) # always last line of test
```

# Python Test Code – User Buttons

```
def TST002_Buttons(self):  
    """ Select one of three buttons  
    - capture the button index in the test record  
    """  
    ctx = self.item_start() # always first line of test  
  
    self.log_bullet("Please press a button!")  
  
    buttons = ["one", "two", "three"]  
    user_select = self.input_button(buttons)  
    if user_select["success"]:  
        b_idx = user_select["button"]  
        self.log_bullet("{} was pressed!".format(buttons[b_idx]))  
        _result, _bullet = ctx.record.measurement("button", b_idx, ResultAPI.UNIT_INT)  
        self.log_bullet(_bullet)  
    else:  
        _result = ResultAPI.RECORD_RESULT_FAIL  
        self.log_bullet(user_select.get("err", "UNKNOWN ERROR"))  
  
    self.item_end(_result) # always last line of test
```

- When a test requires Operator input, one option is buttons
- Shows is the Test panel presenting three buttons to the Operator

# Python Test Code – Text Input

- For the case when text input is needed
  - Text input is NEVER a good thing for production environment, too slow and error prone
  - However this input is meant for **Barcode Scanners**, which can output text like a keyboard.
    - For example, scanning lot codes of parts used on a DUT

```
def TST008_TextInput(self):  
    """ Text Input Box  
    """  
    ctx = self.item_start() # always first line of test  
  
    self.log_bullet("Please Enter Text!")  
  
    user_text = self.input_textbox("Enter Some Text:", "change")  
    if user_text["success"]:  
        self.log_bullet("Text: {}".format(user_text["textbox"]))  
  
        # qualify the text here,  
        # make sure you don't timeout...  
  
        _result = ResultAPI.RECORD_RESULT_PASS  
    else:  
        _result = ResultAPI.RECORD_RESULT_FAIL  
        self.log_bullet(user_text.get("err", "UNKNOWN ERROR"))  
  
    self.item_end(_result) # always last line of test
```

# JSON Results

- Human readable
  - Very useful in development; Can be encrypted
- Normalized, all results have the same structure, making it easier to process SQL in a standard way
- Each Result has unique RUID
- Measurement data “name” is a full path to the test
- Support for Postgres JSONB objects

- Scripts "subs" section can define items that are to be set at test time
- For example,
  - Lot Number
  - Location
  - Measurement limits
- Definition controls user options
- Regex patterns are also supported for text entry fields

- Travellers can be made to capture all subs variables, and then scanned on the production floor
- No manual entry by test operators

# Result Flow

- (JSON) Result files flow upwards
- Backups are made along the way
- Any TMIServer can present a dashboard based on the results within its SQL DB
- TMISStation also back backup data

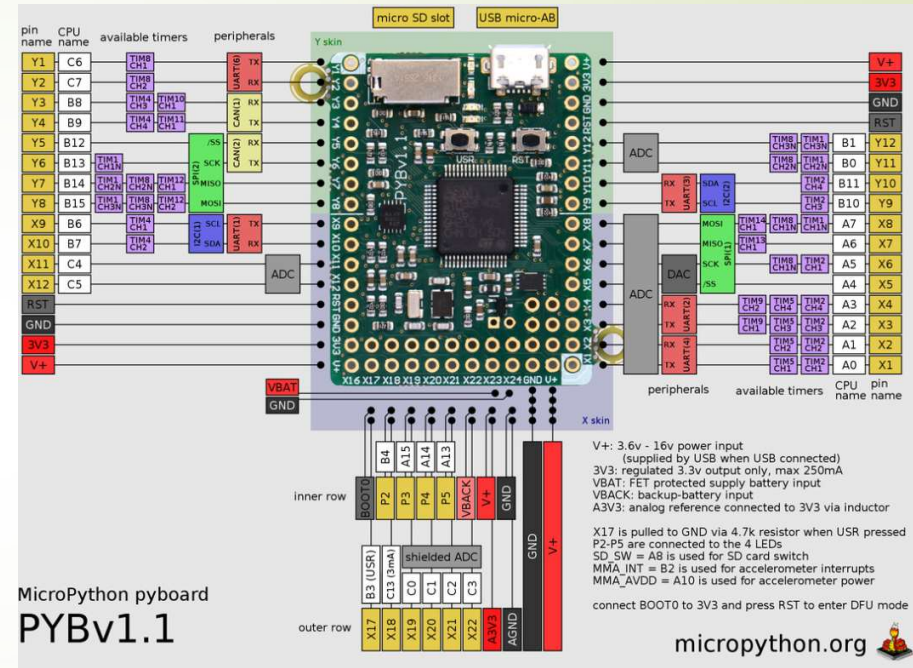

# System HW Block Diagram

## MicroPython Test Instrument

- Low Cost
  - Read/Write GPIOs
  - ADC
  - Proxy for Serial, I2C, SPI commands
- 
- NOTE: The MicroPython board may not be suitable for your application. This board is used to demonstrate and develop the features of the framework.

# MicroPython Interface Proto Board v1.x

- Regardless of your PCB design, if you place test pads to **use any subset** of the 28 pads that are in this arrangement – then you can use this already designed Interface Board
- Any of the test points can be connected to the MicroPython board which can make ADC measurements, GPIO, UART, I2C and other functions
- This Interface board also supports 2 programmable Voltage rails and one current measurement sensor
- Your exact test point needs should be described and checked to see if they can be satisfied by the MicroPython Interface Board v1.x

Your PCB Design (grid is 50x50mils)

- The MicroPython Interface Board is available on CircuitMaker as a project that can be forked, modified for your requirements

In  
Development

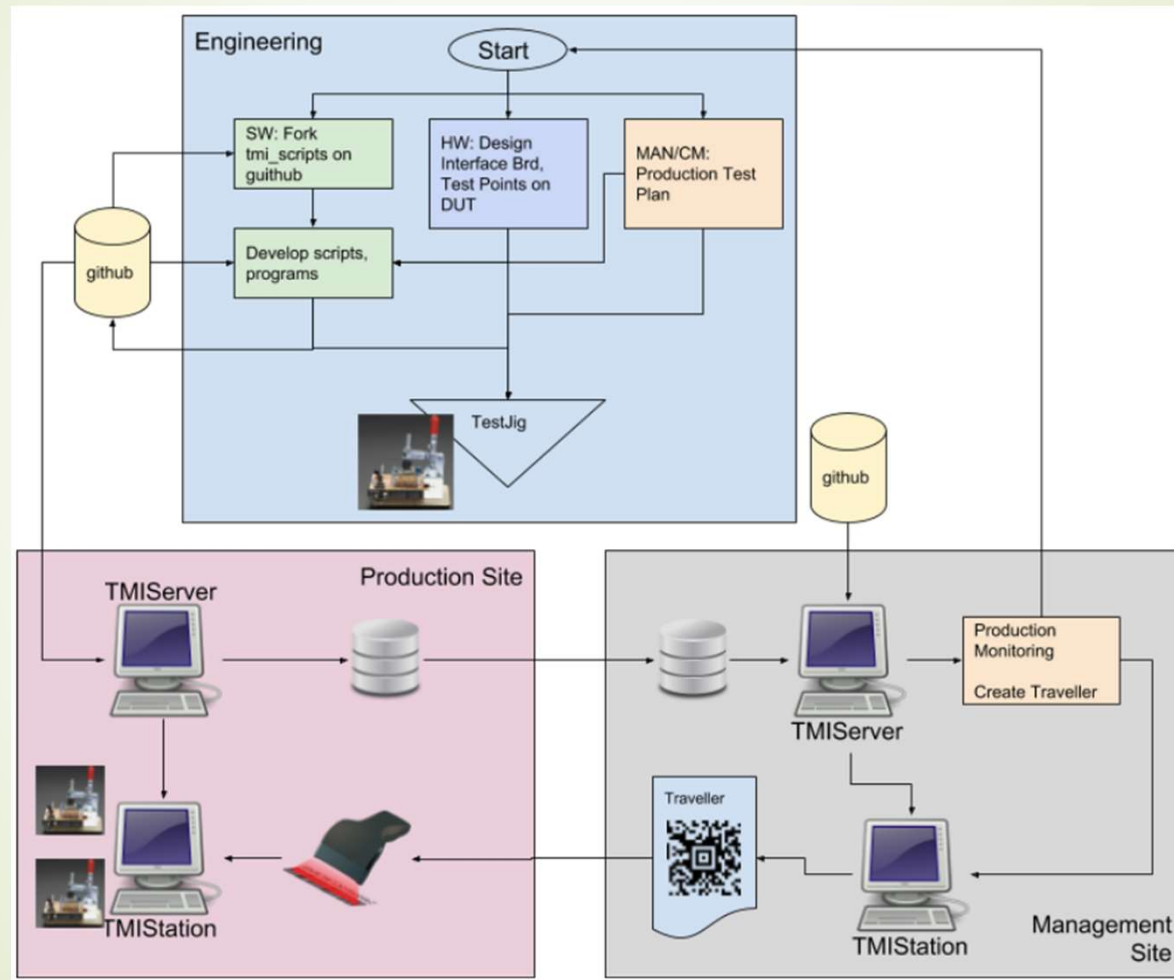

# DUT Design for Testability

- Add test points for the bed of nails jig
- Understand the MicroPython Board IO pin capabilities
  - Or create your own “interface board”
- Create PCB to interface MicroPython Board to the DUT
  - Or use the already designed MicroPython Board V1.x
- Determine what external test equipment is required to test things that can't be tested with MicroPython Board
- Write (Python 3.6) Software within this framework...
  - Results will be normalized, stored in SQL DB
  - Logging
  - Results Dashboard

# Development/Production Model

# Security

- ▀ Accounts
  - ▀ User assigned Roles for access to different system features
  - ▀ PWs stored encrypted
- ▀ Results
  - ▀ can be encrypted
- ▀ TMISStation
  - ▀ Code/Scripts can be “locked down”, tests will not start if any locked down file has been altered
  - ▀ Travellers to control
    - ▀ what Script is run,
    - ▀ what variable parameters are used – production operator “hands free”

# Cost

Tier	Cost/Month/Site (CAN\$)	Units/Month
DEV	Free	
1	\$500	0 – 2k
2	\$750	2k – 10k
3	\$1250	10k – 50k
4	\$2000	50k – unlimited

## ➤ Subscription Based Model

- First 3 months are billed up front
  - This is typically “ramp up” phase thus quantities are low, therefore \$1500 up front.
- Second 3 months billed after (at 6 months)
  - Tier is determined by the average within the last 3 months
- Sites are production sites,
  - Engineering sites are excluded
  - Repair sites are included
  - Maximum of 3 sites (more sites are free)

# Project Current Status

- ▶ Ready to Demo
- ▶ Features in Development
  - ▶ More dashboard statistical graphs
  - ▶ More TMIServer – TMISStation management tasks

# Other

- DUT measurements
  - Considering the Diligent Analog Discover 2
    - 2CH (100Msample/sec) scope, GPIO, Power sources, Digital Bus Analyzers (SPI, I<sup>2</sup>C, UART, Parallel)
    - Python drivers
    - CON
      - \$400 each!
      - No (serial, i2c, etc.) ports
